
Cirepil® Blue

Cirepil® Blue is a stripless wax with a creamy gel texture. It is suitable for normal to oily skin types. It can remove hair that has been growing for three days or three weeks. Cirepil Blue is less aggressive than other waxes enabling the client to receive waxing services on a weekly basis, if desired. Cirepil Blue is best suited for use on face, underarms, neck, bikini, Brazilian services, and men's grooming. It remains pliable and features the patented shrink wrap technology which means the wax shrinks down tight around the hair and pulls the hair out rather than breaking it off. It has great encapsulating results on all hair lengths and textures.

Ingredients

Ethylene/Copolymer/Elastomer, Rosin, Beeswax, Glycerol Rosinate, Lanolin, Ethylene/VA Copolymer, Triethanolamine, Technical Hydroabietyl Alcohol, FDC Blue.

4 Steps of Preparation for Applying Blue Cirepil Wax:

1. Always test the temperature of wax on the inside of your wrist. Wax should be close to body temperature for maximum client comfort.
2. Prepare the area to be waxed with and appropriate cleanser for waxing while examining the direction of the hair growth.
3. Protect the skin by massaging a very small amount of an appropriate pre-deplation oil into the area to be waxed (one drop for the face and a few drops for larger areas).
4. Blot with tissue to remove excess oil.

Stripless Wax Application

For stripless wax application, the following is recommended:

1. Using a wooden disposable spatula, scoop a quarter sized amount of wax from the tin, smooth/scrape the underside of the spatula against tin, turn spatula several rotations to disconnect from the tin of wax and lessen dripping.
 2. Deposit the entire amount of wax onto skin, using the edge of the spatula, spread and apply pressure in the direction of the hair growth. The narrow section of wax should be applied thin and even with a ridge around perimeter for easy wax removal.
 3. Holding the skin taught, lift the ridge and remove the wax parallel and close to the skin in the opposite direction of hair growth. Be sure to allow time to let wax set before removal, body and room temperature may slow or speed the set up process for the wax.
 4. To complete the service, apply a suitable moisturizing lotion and/or moisturizing oil for a cooling, soothing, and hydrating finish.
